Sprint 4 Report - FreeBay, Team Low Expectations, 12/2/2019

Actions to stop doing:

Spikes on planning or design for any part of the project. We have most of the functionality that we need in order to hit our MVP.

Actions to start doing:

We would like to start adding geo-location features along with attempting to implement google API. We decided to backlog those features until we hit our minimum viable product and achieve more necessary features. We need to add the ability to like a post and have the like translate to the posters id on firebase. This will act as a reputation system for each user. Along with this, we can begin unit testing the project

Actions to keep doing:

We have gotten into our stride when it comes to using android studio and can work on more advanced functionality within the app. We can continue to polish our UI and having the proper button placement. We can keep continuing to improve our knowledge on how to implement the Google Vision API and Google Geolocation API. We also need to add functionality to our work button.

Work completed:

UI functionality. Sharing posting functionality. Remove Account functionality. Filtering listing functionality. Favoriting listings functionality. Being able to view my listing page. Allow user to input email and phone number when creating a listing.

Spikes:

Android Studio UI, Firebase data management

Work completion rate:

Total number of user stories completed: 2

Total number of user stories in progress: 0

Total number of days: 14 days

Total number of estimated ideal work hours: 35 hours
